HIGH-LEVEL DOCUMENTATION

Jade RESQ

An AI service desk that works alongside your IT service management tool. Employees get help in chat, tickets are triaged and routed automatically, and privileged requests wait for human approval.

ITSM | Last reviewed 8 October 2026 | 10 min read

> Intelligent IT service management platform providing incident management, service request automation, approval workflows, ticket orchestration, self-service operations, and IT support automation.

01

Overview

Service desks spend much of their day on repeat requests, such as locked accounts, slow laptops and VPN (virtual private network) problems. Jade RESQ (Resolution Engine for Service & Queries) is an artificial intelligence (AI) service desk. It works on top of your existing information technology (IT) service management (ITSM) tool. Employees describe a problem to a chat assistant. It answers from your standard operating procedures (SOPs) or guides them through a fix. When a ticket is needed, RESQ raises it in the ITSM tool, which stays the source of truth. A resolution pipeline then classifies each ticket and finds the relevant SOP. It resolves the ticket, holds it for approval, or escalates it to a level 2 (L2) team with full notes. On the Jade Infra SmartOps Portal, Jade RESQ is the ITSM application, next to the automation, analytics and security tools. The live demo runs on sample data, and automated fixes run as dry runs.

02

Who it's for

E

Employees

Get help from the assistant, raise tickets and follow their progress.

SD

Service desk agents

Work tickets with AI triage, run playbooks and review every AI run.

SD

Service desk managers

Watch volume forecasts, service level agreement (SLA) risk and live AI activity.

IA

IT administrators

Approve privileged requests, connect the ITSM tool and set the branding.

PC

Presales and client teams

Demonstrate an AI service desk without connecting customer systems.

03

Key capabilities

Self-service operations

- **Chat assistant**
  Pick a topic or describe an issue, and get SOP-based answers that show their sources.
- **Guided fixes**
  Follow step-by-step chats for account lockouts, VPN access, slow laptops and SharePoint access.
- **Ticket on request**
  Ask for a ticket, and RESQ raises it with the conversation attached.

Incident management

- **Ticket list**
  View tickets from the connected ITSM tool, filter them by status and search them.
- **New tickets**
  Create an incident, service request, problem, change or question.
- **Ticket detail**
  See the AI's recommended resolution, the audit trace and the notes written back.

Ticket orchestration and IT support automation

- **Continuous AI triage**
  A background process matches each open ticket to an SOP and a playbook.
- **Resolve with AI**
  Start the resolution pipeline on a ticket and watch each stage stream live.
- **Confidence-based decisions**
  RESQ resolves confident, low-risk tickets, holds risky ones and escalates the rest.
- **Escalation with context**
  Escalated tickets go to the right L2 group with a worklog of every step.

Service request automation and approval workflows

- **Playbooks**
  Run multi-step resolution recipes, such as password reset and licence requests.
- **Approval gate**
  Privileged actions pause until an administrator approves or rejects them.
- **SharePoint access workflow**
  Follow an eight-step tracker from request intake to the site owner's sign-off.
- **Owner reminders**
  Folder owners get an approval link, business-day reminders, and escalation after three.

Insights and administration

- **Ticket Intelligence**
  Forecast ticket volume, predict a request's category, priority and group, and spot recurring subjects.
- **Manager dashboard**
  Track ticket totals, auto-resolution rate, escalations, SLA risk and live AI activity.
- **Logs**
  Filter every AI run by user, playbook, source and outcome.
- **Settings**
  Connect a Freshservice account, change the branding and restore the sample data.

04

How it works

Jade RESQ has three parts: a web app in the browser, one backend service that holds the AI logic, and connectors to outside systems.

When you send a chat message, the backend checks whether a guided flow covers the issue. A guided flow asks one question per turn and runs checks between turns, such as reading an account's lockout status. Otherwise, RESQ retrieves matching passages from its SOP library, which is built from Word documents. A large language model (LLM) then writes an answer based on those passages.

Tickets follow a resolution pipeline. Intent detection classifies the request, and RESQ retrieves the relevant SOP passages. One of ten domain agents, such as Windows or Microsoft 365, builds an execution plan. A decision engine weighs the plan's confidence and risk against set thresholds. It picks auto-resolve, hold for approval, or escalate. Automation runners carry out the plan's steps. The outcome, notes and status are written back to the ITSM tool, and every stage goes into an audit trail.

Background tasks triage open tickets and send reminders for pending owner approvals. They can also retrain the Ticket Intelligence models from historical ticket exports.

See the **architecture diagram** for how the components connect.

05

Getting started

On the Jade Infra SmartOps Portal, find the **Jade RESQ** card and select **Launch Demo**. The Jade RESQ product page opens in a new tab. Select **View live demo** to reach the sign-in page.

You sign in with an email address and password. Request demo access from the portal team.

The **AI Service Desk** home page opens first. It shows ticket figures, support options, the chat assistant and **My recent tickets**. The sidebar shows only the pages your role allows.

1. In the home page chat, choose **Account & Security**, then **My account is locked out**. Give your own sign-in email when asked.
2. Select **Tickets** in the sidebar and open a ticket.
3. Read **AI Triage — recommended resolution**, then select **Resolve with AI**.
4. With the agent or administrator role, open **Approvals** to see requests waiting for sign-off.
5. Press Ctrl+K (⌘K on a Mac) to jump to any page or ticket.

06

Common tasks

01 Get help from the assistant

1. Select **Assistant** in the sidebar, or **Chat with AI** from any page.
2. Choose a topic, such as **Network & VPN**, then an issue. Or type your problem in the **Type a message...** box.
3. Answer the assistant's questions with the reply buttons or by typing.
4. Select **Browse topics** to raise another issue, or **End chat** when you're done.

02 Raise a ticket

1. Select **New ticket** in the top bar or on the **Tickets** page.
2. Enter a **Subject**, which is required, and a **Description**.
3. Set the **Type**, **Priority** and **Group**, then select **Create ticket**.

03 Resolve a ticket with AI

1. Select **Tickets**, choose a status tab such as **Open**, and open a ticket.
2. Review **AI Triage — recommended resolution** for the issue, SOP solution and matching playbook.
3. Select **Resolve with AI**. Agents and administrators can select **Run this playbook** instead.
4. Watch the stages stream in, then check **Audit trace & notes** for the recorded stages.

04 Approve or reject a held request

1. As an administrator, select **Approvals** and review each request under **Pending**.
2. Select **Approve** to run the held plan, or **Reject** to escalate the ticket to L2.
3. Find past decisions, with the approver's name, under **Decided**.

05 Request access to a SharePoint folder

1. In the assistant, choose **Email & Collaboration**, then **I can't access a SharePoint folder**.
2. Type the department folder's name, or paste its SharePoint link.
3. If you don't have access yet, choose the access level and how long you need it.
4. Review the summary. RESQ raises a ticket and routes an approval request to the folder owner.

07

Roles and permissions

ROLE	WHAT THEY CAN DO
User	Use **Home**, **Tickets**, **Assistant** and **Cloud**; create tickets; start **Resolve with AI** on any ticket.
Agent	Everything a user can do, plus **Playbooks**, **Logs**, **Predictions**, **Manager** and a view-only **Approvals** page.
Administrator	Everything an agent can do, plus approve or reject requests, retrain models, and use **Agents** and **Settings**.
Folder owner (no account)	Approve or reject a SharePoint request from a private link.

08

Integrations

SYSTEM	WHAT IT'S USED FOR	DIRECTION
Freshservice	Reading tickets, read-only, from an account connected in **Settings → ITSM Integrations**.	Inbound
Azure OpenAI language model	Writing chat answers from SOP passages, and drafting notes to requesters.	Outbound
Google Chat	Employees chat with the assistant from Google Chat. Set up per deployment.	Both

09

Security and data

- **Sign-in:** email and password, with passwords stored as hashes. Sessions expire after eight hours. Single sign-on isn't enabled.
- **Authorization:** the server checks each signed-in request against three roles: user, agent and administrator.
- **Audit trail:** each pipeline stage is recorded as an append-only entry, and **Logs** shows who started each AI run.
- **Data processed:** tickets, chat messages and requester details. Chat messages and SOP passages go to the language model.
- **Credentials:** ITSM sign-in details entered in **Settings** stay on the server and never return to the browser.
- **Encryption in transit:** the demo is served over HTTPS (Hypertext Transfer Protocol Secure).
- **Retention:** demo data is held in memory and cleared on restart or reset. Chat history expires after four hours.

10

Operations at a glance

- **Hosting:** single-tenant, one deployment per customer. The demo runs on the portal's shared server.

- **Background processing:** AI triage scans open tickets every 15 seconds, and an approval timer sends reminders.
- **Health check:** a public health endpoint reports whether the service is up and in demo mode.
- **Resilience:** the backend restarts automatically if it stops.

11

Limitations

- ! The demo uses sample tickets, users and folder owners. Account checks and unlocks use demo data.
- ! Automated steps run as dry runs, so the demo changes no real systems.
- ! Only three of the ten domain agents are fully built: Windows, Microsoft 365 and Cloud. Other tickets escalate.
- ! In the demo, ticket analysis returns sample results. Chat uses the live language model.
- ! Owner approval requests aren't sent by email or Microsoft Teams from the demo.
- ! Only Freshservice can be connected. ServiceNow and Jira show as **Coming soon**.
- ! **Cloud provisioning** is a placeholder, and **Request a call** doesn't contact anyone.
- ! The home page response time, SLA and satisfaction figures are fixed demo values.
- ! **Ticket Intelligence** shows sample predictions until an administrator retrains the models.
- ! The web chat doesn't list SharePoint folders yet, so type the folder name.
- ! Duplicate detection isn't active, and every user can see all tickets.
- ! There are no screens for users, SOP uploads or thresholds.
- ! All visitors share one demo dataset, so changes are visible to others.

12

FAQ

Q **Does Jade RESQ replace our ITSM tool?**

No. Your ITSM tool keeps the ticket records. The demo uses a sample connector.

Q Will the demo change any real systems?

No. Automation runs as dry runs, directory checks use demo data, and approval messages aren't sent.

Q Which AI does it use?

Chat answers use an Azure OpenAI language model. Triage and predictions use rules and machine learning.

Q What if the AI can't solve a request?

RESQ escalates it to the right L2 group with a worklog of what it tried.

Q Can we use our own SOPs and branding?

Yes. SOPs and playbooks are files loaded at startup. Administrators set branding under **Settings**.

Q Is the demo data private to me?

No. All demo users share one dataset, which an administrator can restore with **Reset demo data**.

13

Glossary

TERM	MEANING
AI	Artificial intelligence.
IT	Information technology.
FAQ	Frequently asked questions.
ITSM	IT service management: the tool a service desk uses to track tickets.
SOP	Standard operating procedure: an approved fix for a known issue.
LLM	Large language model: the AI model that writes chat answers.
L2	Level 2 support: the specialist team behind first-line support.
SLA	Service level agreement: the agreed time to resolve a ticket.
VPN	Virtual private network: a secure link to the company network.
HTTPS	Encrypted web traffic.
Approval gate	Where a privileged action waits for a person's decision.
Audit trail	An append-only record of every AI step.
Decision engine	Picks auto-resolve, hold or escalate from confidence and risk.
Domain agent	A specialist AI component for one area, such as Windows.
Dry run	Running steps without changing the target system.
Guided flow	A scripted chat that asks one question per turn.
Intent detection	Classifying what a request is about.
Playbook	A multi-step resolution recipe.

TERM	MEANING
Resolution pipeline	The stages a ticket goes through, up to write-back.
Single-tenant	One separate deployment per customer.
Ticket Intelligence	Machine learning that forecasts volume and predicts ticket fields.
Triage	Working out what a ticket is about and who should handle it.
Worklog	The note RESQ adds listing the steps it took.
Write-back	Updating the ticket in the ITSM tool.
